

I obtained the data from:

[http://bulbapedia.bulbagarden.net/wiki/List_of_Pok%C3%A9mon_by_base_stats_\(Generation_VI-present\)](http://bulbapedia.bulbagarden.net/wiki/List_of_Pok%C3%A9mon_by_base_stats_(Generation_VI-present))

These are records for Pokemon listing their identification number, name, hit points, attack, defense, special attack, special defense, and speed.

POKE-ANAYLSIS

I learned from my analysis the truth behind the weakest and strongest Pokemon.

Those who aren't familiar with the card game most people who play are looking for a Pokemon with high hit points (like Charizard or Rayquaza). I always thought that high hit points meant that that Pokemon was unstoppable. I was wrong. After a thorough analysis, there were some Pokemon who exhibited very high hit points but the other stats were incredibly low. Through my analysis I added constraints to filter out this issue and was able to find the strongest Pokemon who exhibited not only a high hit points but highs in all the other stats.
